

Concrete Institute Heavy Duty Pavement Seminar - 2016

This year BOSFA were asked if we could be involved in the Concrete Institutes Heavy Duty Pavement seminar, something that the team at BOSFA are very passionate about as a large portion of our work is talking to consultants about the design of steel fibre reinforced concrete pavements. These one day sessions are held in each state of Australia and all the team at BOSFA chipped in to present on the topic.

The Concrete Institutes national seminar series included a diverse range of speakers, from government, consultancies to material suppliers, with topics covering a diverse range of topics.

BOSFA presented on designing HD pavements using our Combi Slab solution which incorporates the use of DRAMIX 4D fibres and traditional reinforcement. There are many reasons for adopting a Combi Slab solution but one of the aspects of these HD pavements that was continually raised was the need to remove joints in these HD pavements and that is exactly what Combi Slab can offer a design.

It was great to see the Combi Slab method of design being acknowledged by some the industry's leading consultant's as the way forward in HD pavement design.

We would like to take this opportunity to thank the Concrete institute of Australia for asking BOSFA to be a part of these very important sessions

Don't forget you can organise a training session with any of the BOSFA team local to your state.
